Personal Health Report

Complete Care Total
with **Smart+ Health Report**

A comprehensive analysis of your
health using **Blood data**

06/07/2021
Date of test

06/07/2021
Report released on

Your Health Summary - Complete Care Total with Smart+ Health Report

Congratulations for getting a health check done. This is the first step towards taking control of your health. We noticed that you are doing well with the following:

- Sugar tested is normal
- Blood calcium is normal
- Thyroid function test is normal
- Hemoglobin levels are normal

Please note! There are a few test results which seem abnormal and need your attention.

- Liver function tests are out of range
- Vit D is low of range

Your Health Picture

Disclaimer (This report contains two sections: 1. Analysed Smart Report 2. Lab Diagnostic Report)

- If you are pregnant, some of the recommendations in the Smart Report may not directly apply to you. Please consult your doctor.
- The analyzed information in the Smart Report is not ideal for individuals less than 15 years of age.
- Health Vectors will not be liable for any indirect, direct, special, consequential or other damages.
- This report is not intended to replace your doctor. Please make sure you consult your doctor before further actions.
- Please be careful of any food allergies or intolerances that you are sensitive to.
- Analysis uses Blood data (and urine data if present).

HEPATITIS B SURFACE ANTIGEN

Value: NON REACTIVE

OTHER TESTS

LACTATE DEHYDROGENASE

Value: 178
Range: 100-190

Some of Your Important Parameters Explained

Vitamin D

Result: **29.94**

Range: **30-100**

Vitamin D is called the "sunshine" vitamin. When the sun's light rays enter bare skin, it sets off a reaction in the body that produces vitamin D.

As many of us spend more time indoors, we're lacking in Vitamin D.

Cause / Effect of these parameters

Vitamin D deficiency causes weak bones which we may feel like bone pains, muscle pains or muscle weakness.

What can you do about it?

You have borderline Vit D. Your doctor can help you with supplements of vitamin D.

Exposure to sunlight will cause vitamin D production in the body. Avoid spending more time indoors.

Limit the use of sunscreen lotions.

Total Cholesterol

Result: **184**

Range: **0-200**

Cholesterol is a waxy, fat-like substance that is found in the blood. It is required by the body to build cells. But too much cholesterol can be a problem.

Cholesterol comes from two sources. The liver makes all the cholesterol we need. The remainder of the cholesterol in the body comes from foods derived from animals.

In young adults (15-19yrs old) TC <170 mg/dL is considered normal.

Cause / Effect of these parameters

Cholesterol travels through the blood on proteins called lipoproteins. Two types of lipoproteins carry cholesterol throughout the body.

- LDL-C (Low Density Lipoprotein Cholesterol) is also known as "bad" cholesterol.
- HDL-C (High density lipoprotein Cholesterol) is also known as "good" cholesterol.

What can you do about it?

You have slightly elevated levels of Total cholesterol in your body. You can reduce them by following a healthy diet, keeping your weight in control, limiting your sugar intake, eating more fibre, exercising regularly (like outdoor games more than 60 mins per day).

Some of Your Important Parameters Explained

Alk. Phosphatase

Result: **160**

Range: **30-120**

ALP (alkaline phosphatase) is an enzyme present mainly in your bones & liver.

ALP test measures the amount of enzyme in your bloodstream.

Increased blood ALP levels are seen when the liver function is deranged or there is bone involvement.

Cause / Effect of these parameters

High levels of ALP in the blood are usually seen if there are issues in the

- Gall bladder (infection, gall bladder stone etc.)
- Liver (infection, cirrhosis etc.)
- Bones (weak bones due to Vit D or calcium deficiency etc.)
- Smoking, especially with alcoholism
- Others

What can you do about it?

Your doctor will help you in evaluating the causes for increased ALP. Depending on further evaluation, you will be suggested the management.

HbA1c

Result: **5.5**

Range: **0-5.7**

HbA1c is a blood test performed to measure the average sugar in the blood for the past 2 to 3 months.

If the HbA1c has been higher than 6.5% on many occasions, then it is said to have crossed into diabetic ranges.

HbA1c levels higher than normal indicate poor control of blood sugars for the past 2 to 3 months.

Cause / Effect of these parameters

The symptoms of diabetes can be mild and go unnoticed.

Common symptoms of diabetes are:

- Urinating often and feeling very thirsty
- Feeling very hungry and also losing weight- even though you are eating more
- Cuts/bruises that are slow to heal
- Fatigue
- Tingling, pain, or numbness in hands/feet etc.

What can you do about it?

Congratulations, your HbA1c has tested normal. Your last 3 months sugar control has been normal.

- Follow a low carb/low sugars diet to keep it normal.
- Exercise regularly if your doctor allows you.

Some of Your Important Parameters Explained

Creatinine

Result: **0.80**

Range: **.5-1**

A creatinine blood test measures the level of creatinine in the blood.

Creatinine is a waste product that is formed when creatine, which is found in the muscles, breaks down. Creatinine is filtered out of the body from the kidneys. So, Creatinine levels in the blood can tell the doctor how well the kidneys are filtering.

Cause / Effect of these parameters

High levels of creatinine in blood may mean the kidneys are getting damaged.

What can you do about it?

You are doing well to keep your Creatinine levels in control.

Keep yourself well hydrated by drinking plenty of water on a daily basis if your doctor allows.

Avoid over the counter medicines and always consult your doctor before taking any medications.

TSH

Result: **3.430**

Range: **.51-4.3**

TSH (Thyroid Stimulating Hormone) is a hormone secreted by brain (pituitary gland) which regulates the production of thyroid hormones (T3,T4) from the thyroid gland in the neck.

TSH level that is too high or too low can indicate the thyroid gland isn't working correctly. High TSH levels indicate under active thyroid gland (hypothyroidism). Low TSH levels in the blood indicate hyperactive thyroid gland (hyperthyroidism).

Cause / Effect of these parameters

Symptoms of hyperthyroidism include

- Nervousness & anxiety
- Tiredness
- Twitching or trembling
- Irregular or fast heart beats
- Weight loss, etc.

Symptoms of hypothyroidism include

- Tiredness
- Weight gain
- Infertility
- Constipation
- Pregnancy complications etc.

What can you do about it?

Your TSH levels are normal.

Your Diet Dos & Don'ts

The following are covered in your Diet Dos & Don'ts :

Bones strengthening | Vitamin D rich | Immunity improving diet | Cholesterol Care

Fruits and Vegetables

- ✓ Have 4-5 servings of fruits and vegetables daily
- ✓ Consume butter fruit/avocado as it is known to increase HDL and decrease LDL
- ✓ Try to include a serving of fruit or vegetable in every meal and snack time
- ✓ Include mushrooms (if you consume) in your diet, as they are rich in vitamin D
- ✓ Consume vegetables like okra, fenugreek leaves (methi), drumstick leaves etc. as they are rich in calcium
- ✓ Figs are a good source of calcium
- ✓ Broccoli and cabbage are rich in calcium
- ✓ Vitamin C rich fruits and vegetables like capsicum, sweet lime, guava, kiwi, lemons are essential to improve immunity
- ✓ Vegetables and fruits like mushroom, beans, grapes, lettuce are rich in B complex vitamins, chromium and selenium which help improve immunity
- ✓ Broccoli and spinach are rich in chromium, selenium and B complex vitamins which are essential for immunity
- ✓ Consume 1-2 garlic cloves in the morning on empty stomach as it helps increase good cholesterol and reduce bad cholesterol
- ✓ Consume high fiber vegetables like okra, eggplant (brinjal), carrots etc. for cholesterol management
- ✗ Rather than drinking fresh fruit juices, it is preferable to eat the fruit

Cereals

- ✓ Consume millets like ragi, jowar, bajra, etc.
- ✓ Have high fiber cereals like brown rice, red rice, whole wheat, oats, quinoa etc.
- ✓ Have a wholesome breakfast cereal high in fibre like broken wheat/oatmeal/quinoa porridge whole wheat chapati/multigrain sandwich
- ✓ Ragi and its products like ragi flour and ragi malt are good sources of Calcium.
- ✓ Have breakfast cereals (cornflakes, wheat flakes, muesli, etc.) Fortified with Vitamin D
- ✓ Whole grains like wheat, barley, oats, brown rice are rich sources of Zinc, Chromium, B complex vitamins that help improve immunity.
- ✗ Avoid using refined cereals like maida, corn flour, white rice, etc.

Your Diet Dos & Don'ts

Pulses

- ✓ Consume dal with husk (skin)
- ✓ Consume rajma, green mung
- ✓ Have pulses like (kabuli chana , green and black chana)
- ✓ Consume pulses like lobia, rajma, moong, kabuli channa and dals as they are rich sources of Zinc, selenium and B complex vitamins that help improve immunity

Dairy

- ✓ Have skimmed or low fat milk and its products like curd, paneer etc.
- ✓ Have milk and milk products which are additionally fortified with vitamin D everyday
- ✗ Avoid high fat or sweetened dairy products like khoa, cheese, sweetened yogurt, malai paneer (instead have low fat paneer)
- ✗ While having milk do not add coffee or tea decoction to it

Nuts and Seeds

- ✓ You can snack on whole nuts like almonds, walnuts, groundnuts, etc. in small quantities between meals.
- ✓ Add flaxseeds, chia seeds or sabja seeds (high in omega 3 fatty acids) to your cereals, salads, yogurt, dal
- ✓ Consume almonds, chia seeds, sabja seeds, sesame seeds, etc. as they are rich in calcium
- ✓ Nuts and seeds like almonds, cashew nuts, sesame seeds, sunflower seeds are rich in nutrients like Zinc, Selenium, B complex vitamins that help to improve immunity
- ✗ Avoid consumption of salted or fried nuts

Oils and Fats

- ✓ Consume only 1-2 teaspoons of oil in a day. Some of the good oils are sunflower, rice bran, ground nut, olive oil, etc. Use these oils in rotation rather than sticking to one
- ✓ It is better to use cold pressed oils
- ✓ Keep oil consumption to not more than half litre per person per month
- ✗ Limit consumption of saturated fats like ghee, butter, etc.
- ✗ Avoid fried foods
- ✗ Avoid high fat items like peanut butter, mayonnaise, etc.

Your Diet Dos & Don'ts

Meats

- ✓ Eat high quality lean proteins which are normally present in egg whites and chicken
- ✓ Include 1-2 portions of fatty fish like salmon, mackerel or tuna in a week
- ✓ Salmon (canned and fresh), fishes with edible bones, like sardines are rich sources of calcium
- ✓ Consume fatty fish and sea foods like mackerel, sardines, tuna, shrimps, salmon etc. as they are the richest natural food sources of vitamin D
- ✓ Lean poultry meat like chicken is rich in nutrients like zinc, selenium and B complex vitamins that are essential to improve immunity
- ✓ Fish and shell fish contain zinc, selenium, B complex vitamins that help improve immunity
- ✗ Avoid red meat (mutton, lamb, beef, pork, etc.)
- ✗ Meat should be properly cooked. Avoid raw/ undercooked meats
- ✗ Avoid consumption of cured meats like dry salted fish or meat, sausages, salami, etc. as they are very rich in salts, fats and artificial preservatives
- ✗ Avoid egg yolk (yellow)

General Advice

- ✓ Consume 4-5 small meals rather than three big meals and avoid skipping meals
- ✓ If you feel hungry between meals, it's okay to snack, but just remember to eat healthy snacks like fruit bowl, sprouts salad, nuts, etc.
- ✓ Drink at least 8-10 glasses of water every day if your doctor allows
- ✓ Use healthy cooking methods such as steaming, boiling, roasting, stewing and poaching
- ✓ Read food labels and choose your foods wisely. Limit consumption of foods that have high quantity of preservatives, salt/sodium, trans fats, added sugars, artificial sweeteners, colors and additives
- ✓ Keep at least a 2 hours gap between your last meal and bedtime
- ✓ Pay attention to the food you eat, stop when you feel full and do not overeat
- ✓ Include in your diet light foods like clear soups, lemon juice (without sugar), seasonings like pepper, mint, garlic, curry leaves
- ✗ Avoid sweets (they are high in fats and sugar)
- ✗ Avoid alcohol (if you drink)
- ✗ Avoid sugar and other refined carbohydrates
- ✗ Limit consumption of snacks such as candies, french fries, instant noodles, ice-cream and soft drinks because they contain many calories that not only cause obesity but also affect our appetite and hinder the intake of nutritious food
- ✗ Reduce salt intake as it can increase the amount of calcium excreted through urine

Your Diet Dos & Don'ts

- ⊘ Avoid consumption of too many fizzy drinks as these contain a lot of phosphate, which is used to improve the flavour. Too much phosphate may cause the body to breakdown calcium
- ⊘ Do not have more than 2 cups of coffee a day as it inhibits calcium absorption

Your Next Steps

Doctor Consultation

In view of the reports, please consult:

DOCTOR

CONDITION

Physician

High ALP, low vit D

Other Advice

- Your doctor can help you with supplements of vitamin D. Exposure to sunlight will cause vitamin D production in the body.
- Avoid covering your face hands & feet, when you are out in the sunshine. Limit the use of sunscreen lotions to improve your vitamin D.

Follow Ups

Please check your weight and blood pressure on regular basis. Your doctor knows best - please seek his/her advice for the follow up tests.

After 3 months

- Liver Function Test

After 6 months

- Vit D

How to improve my immunity?

"Our immune system is our first line of defense."

- **Exercise** - If you exercise at least five times a week, you cut the risk of colds by nearly half compared to people who are largely sedentary. Even if you get sick, you will have less severe symptoms
- **Sleep** - Those who sleep less than five hours per night have 4.5 times more chances of developing a cold than those who sleep more than seven hours
- **Diet** - 70% of the immune system is housed in the gut system. To help this, eat healthy foods like green leafy vegetables, citrus fruits, nuts, berries, fish, whole grains, garlic, foods rich in Zinc, Selenium, vitamins A, D, C and E
- Stress less, practice meditation, avoid smoking, alcohol and other addictive substances

Interpretation(s)

BLOOD COUNTS-The cell morphology is well preserved for 24hrs. However after 24-48 hrs a progressive increase in MCV and HCT is observed leading to a decrease in MCHC. A direct smear is recommended for an accurate differential count and for examination of RBC morphology.

RBC AND PLATELET INDICES-The cell morphology is well preserved for 24hrs. However after 24-48 hrs a progressive increase in MCV and HCT is observed leading to a decrease in MCHC. A direct smear is recommended for an accurate differential count and for examination of RBC morphology.

The optimal threshold of 3.3 for NLR showed a prognostic possibility of clinical symptoms to change from mild to severe in COVID positive patients. When age = 49.5 years old and NLR = 3.3, 46.1% COVID-19 patients with mild disease might become severe. By contrast, when age < 49.5 years old and NLR < 3.3, COVID-19 patients tend to show mild disease.

(Reference to - The diagnostic and predictive role of NLR, d-NLR and PLR in COVID-19 patients A.-P. Yang, et al. International Immunopharmacology 84 (2020) 106504 This ratio element is a calculated parameter and out of NABL scope.

ERYTHRO SEDIMENTATION RATE, BLOOD-Erythrocyte sedimentation rate (ESR) is a non-specific phenomena and is clinically useful in the diagnosis and monitoring of disorders associated with an increased production of acute phase reactants. The ESR is increased in pregnancy from about the 3rd month and returns to normal by the 4th week post partum. ESR is influenced by age, sex, menstrual cycle and drugs (eg. corticosteroids, contraceptives). It is especially low (0-1mm) in polycythemia, hypofibrinogenemia or congestive cardiac failure and when there are abnormalities of the red cells such as poikilocytosis, spherocytosis or sickle cells.

TOTAL IRON BINDING CAPACITY, SERUM-Total iron binding capacity (TIBC) measures the blood's capacity to bind iron with transferrin and thus is an indirect way of assessing transferrin level.

Taken together with serum iron and percent transferrin saturation this test is performed when there is a concern about anemia, iron deficiency or iron deficiency anemia. However, because the liver produces transferrin, alterations in liver function (such as cirrhosis, hepatitis, or liver failure) must be considered when performing this test.

Increased in:

- iron deficiency
- acute and chronic blood loss
- acute liver damage
- progesterone birth control pills

Decreased in:

- hemochromatosis
- cirrhosis of the liver
- thalassemia
- anemias of infection and chronic diseases
- nephrosis
- hyperthyroidism

The percent Transferrin saturation = Serum Iron/TIBC x 100

Unsaturated Binding Capacity (UIBC)=TIBC - Serum Iron.

Limitations: Estrogens and oral contraceptives increase TIBC and Asparaginase, chloramphenicol, corticotropin, cortisone and testosterone decrease the TIBC level.

GLUCOSE, FASTING, PLASMA-ADA 2012 guidelines for adults as follows:

Pre-diabetics: 100 - 125 mg/dL

Diabetic: > or = 126 mg/dL

(Ref: Tietz 4th Edition & ADA 2012 Guidelines)

GLYCOSYLATED HEMOGLOBIN, EDTA WHOLE BLOOD-

Glycosylated hemoglobin (GHb) has been firmly established as an index of long-term blood glucose concentrations and as a measure of the risk for the development of complications in patients with diabetes mellitus. Formation of GHb is essentially irreversible, and the concentration in the blood depends on both the life span of the red blood cell (average 120 days) and the blood glucose concentration. Because the rate of formation of GHb is directly proportional to the concentration of glucose in the blood, the GHb concentration represents the integrated values for glucose over the preceding 6-8 weeks.

Any condition that alters the life span of the red blood cells has the potential to alter the GHb level. Samples from patients with hemolytic anemias will exhibit decreased glycated hemoglobin values due to the shortened life span of the red cells. This effect will depend upon the severity of the anemia. Samples from patients with polycythemia or post-splenectomy may exhibit increased glycated hemoglobin values due to a somewhat longer life span of the red cells.

Glycosylated hemoglobins results from patients with HbSS, HbCC, and HbSC and HbD must be interpreted with caution, given the pathological processes, including anemia, increased red cell turnover, transfusion requirements, that adversely impact HbA1c as a marker of long-term glycemic control. In these conditions, alternative forms of testing such as glycated serum protein (fructosamine) should be considered.

*Targets should be individualized. More or less stringent glycemic goals may be appropriate for individual patients. Goals should be individualized based on duration of diabetes, age/life expectancy, comorbid conditions, known CVD or advanced microvascular complications, hypoglycemia unawareness, and individual patient considerations."

LIVER FUNCTION PROFILE, SERUM-LIVER FUNCTION PROFILE

Bilirubin is a yellowish pigment found in bile and is a breakdown product of normal heme catabolism. Bilirubin is excreted in bile and urine, and elevated levels may give yellow discoloration in jaundice. Elevated levels result from increased bilirubin production (eg, hemolysis and ineffective erythropoiesis), decreased bilirubin excretion (eg, obstruction and hepatitis), and abnormal bilirubin metabolism (eg, hereditary and neonatal jaundice). Conjugated (direct) bilirubin is elevated more than unconjugated (indirect) bilirubin in Viral hepatitis, Drug reactions, Alcoholic liver disease Conjugated (direct) bilirubin is also elevated more than unconjugated (indirect) bilirubin when there is some kind of blockage of the bile ducts like in Gallstones getting into the bile ducts, tumors & Scarring of the bile ducts. Increased unconjugated (indirect) bilirubin

Test Report Status	Final	Results	Biological Reference Interval	Units
--------------------	-------	---------	-------------------------------	-------

may be a result of Hemolytic or pernicious anemia, Transfusion reaction & a common metabolic condition termed Gilbert syndrome, due to low levels of the enzyme that attaches sugar molecules to bilirubin.

AST is an enzyme found in various parts of the body. AST is found in the liver, heart, skeletal muscle, kidneys, brain, and red blood cells, and it is commonly measured clinically as a marker for liver health. AST levels increase during chronic viral hepatitis, blockage of the bile duct, cirrhosis of the liver, liver cancer, kidney failure, hemolytic anemia, pancreatitis, hemochromatosis. AST levels may also increase after a heart attack or strenuous activity. ALT test measures the amount of this enzyme in the blood. ALT is found mainly in the liver, but also in smaller amounts in the kidneys, heart, muscles, and pancreas. It is commonly measured as a part of a diagnostic evaluation of hepatocellular injury, to determine liver health. AST levels increase during acute hepatitis, sometimes due to a viral infection, ischemia to the liver, chronic hepatitis, obstruction of bile ducts, cirrhosis.

ALP is a protein found in almost all body tissues. Tissues with higher amounts of ALP include the liver, bile ducts and bone. Elevated ALP levels are seen in Biliary obstruction, Osteoblastic bone tumors, osteomalacia, hepatitis, Hyperparathyroidism, Leukemia, Lymphoma, Paget's disease, Rickets, Sarcoidosis etc. Lower-than-normal ALP levels seen in Hypophosphatasia, Malnutrition, Protein deficiency, Wilson's disease. GGT is an enzyme found in cell membranes of many tissues mainly in the liver, kidney and pancreas. It is also found in other tissues including intestine, spleen, heart, brain and seminal vesicles. The highest concentration is in the kidney, but the liver is considered the source of normal enzyme activity. Serum GGT has been widely used as an index of liver dysfunction. Elevated serum GGT activity can be found in diseases of the liver, biliary system and pancreas. Conditions that increase serum GGT are obstructive liver disease, high alcohol consumption and use of enzyme-inducing drugs etc. Serum total protein, also known as total protein, is a biochemical test for measuring the total amount of protein in serum. Protein in the plasma is made up of albumin and globulin. Higher-than-normal levels may be due to: Chronic inflammation or infection, including HIV and hepatitis B or C, Multiple myeloma, Waldenstrom's disease. Lower-than-normal levels may be due to: Agammaglobulinemia, Bleeding (hemorrhage), Burns, Glomerulonephritis, Liver disease, Malabsorption, Malnutrition, Nephrotic syndrome, Protein-losing enteropathy etc. Human serum albumin is the most abundant protein in human blood plasma. It is produced in the liver. Albumin constitutes about half of the blood serum protein. Low blood albumin levels (hypoalbuminemia) can be caused by: Liver disease like cirrhosis of the liver, nephrotic syndrome, protein-losing enteropathy, Burns, hemodilution, increased vascular permeability or decreased lymphatic clearance, malnutrition and wasting etc.

25 - HYDROXYVITAMIN D, SERUM-

Note: Our Vitamin D assays is standardized to be in alignment with the ID-LC/MS/MS 25(OH) vitamin D Reference Method Procedure (RMP), the reference procedure for the Vitamin D Standardization Program (VDSP). The VDSP, a collaboration of the National Institutes of Health Office of Dietary Supplements, National Institute of Technology and Standards, Centers for Disease Control and Ghent University, is an initiative to standardize 25(OH) vitamin D measurement across methods.

CALCIUM, SERUM-Common causes of decreased value of calcium (hypocalcemia) are chronic renal failure, hypomagnesemia and hypoalbuminemia.

Hypercalcemia (increased value of calcium) can be caused by increased intestinal absorption (vitamin D intoxication), increased skeletal reabsorption (immobilization), or a combination of mechanisms (primary hyperparathyroidism). Primary hyperparathyroidism and malignancy accounts for 90-95% of all cases of hypercalcemia.

Values of total calcium is affected by serum proteins, particularly albumin thus, latter's value should be taken into account when interpreting serum calcium levels. The following regression equation may be helpful.

Corrected total calcium (mg/dl) = total calcium (mg/dl) + 0.8 (4 - albumin [g/dl])*

because regression equations vary among group of patients in different physiological and pathological conditions, mathematical corrections are only approximations. The possible mathematical corrections should be replaced by direct determination of free calcium by ISE (available with srl) a common and important source of preanalytical error in the measurement of calcium is prolonged tourniquet application during sampling. Thus, this along with fist clenching should be avoided before phlebotomy.

THYROID PANEL, SERUM-

Triiodothyronine T3, is a thyroid hormone. It affects almost every physiological process in the body, including growth, development, metabolism, body temperature, and heart rate. Production of T3 and its prohormone thyroxine (T4) is activated by thyroid-stimulating hormone (TSH), which is released from the pituitary gland. Elevated concentrations of T3, and T4 in the blood inhibit the production of TSH.

Thyroxine T4, Thyroxine's principal function is to stimulate the metabolism of all cells and tissues in the body. Excessive secretion of thyroxine in the body is hyperthyroidism, and deficient secretion is called hypothyroidism. Most of the thyroid hormone in blood is bound to transport proteins. Only a very small fraction of the circulating hormone is free and biologically active.

In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

Below mentioned are the guidelines for Pregnancy related reference ranges for Total T4, TSH & Total T3

Levels in	TOTAL T4 (µg/dL)	TSH3G (µIU/mL)	TOTAL T3 (ng/dL)
Pregnancy			
First Trimester	6.6 - 12.4	0.1 - 2.5	81 - 190
2nd Trimester	6.6 - 15.5	0.2 - 3.0	100 - 260
3rd Trimester	6.6 - 15.5	0.3 - 3.0	100 - 260

Below mentioned are the guidelines for age related reference ranges for T3 and T4.

T3 (ng/dL)	T4 (µg/dL)
New Born: 75 - 260	1-3 day: 8.2 - 19.9
.	1 Week: 6.0 - 15.9

NOTE: TSH concentrations in apparently normal euthyroid subjects are known to be highly skewed, with a strong tailed distribution towards higher TSH values. This is well documented in the pediatric population including the infant age group.

Kindly note: Method specific reference ranges are appearing on the report under biological reference range.

CORONARY RISK PROFILE (LIPID PROFILE), SERUM-Serum cholesterol is a blood test that can provide valuable information for the risk of coronary artery disease. This test can help determine your risk of the build up of plaques in your arteries that can lead to narrowed or blocked arteries throughout your body (atherosclerosis). High cholesterol levels usually don't cause any signs or symptoms, so a cholesterol test is an important tool. High cholesterol levels often are a significant risk factor for heart disease and important for diagnosis of hyperlipoproteinemia, atherosclerosis, hepatic and thyroid diseases.

--------------------	-------	---------	-------------------------------	-------

Serum Triglyceride are a type of fat in the blood. When you eat, your body converts any calories it doesn't need into triglycerides, which are stored in fat cells. High triglyceride levels are associated with several factors, including being overweight, eating too many sweets or drinking too much alcohol, smoking, being sedentary, or having diabetes with elevated blood sugar levels. Analysis has proven useful in the diagnosis and treatment of patients with diabetes mellitus, nephrosis, liver obstruction, other diseases involving lipid metabolism, and various endocrine disorders. In conjunction with high density lipoprotein and total serum cholesterol, a triglyceride determination provides valuable information for the assessment of coronary heart disease risk. It is done in fasting state.

High-density lipoprotein (HDL) cholesterol. This is sometimes called the "good" cholesterol because it helps carry away LDL cholesterol, thus keeping arteries open and blood flowing more freely. HDL cholesterol is inversely related to the risk for cardiovascular disease. It increases following regular exercise, moderate alcohol consumption and with oral estrogen therapy. Decreased levels are associated with obesity, stress, cigarette smoking and diabetes mellitus.

SERUM LDL The small dense LDL test can be used to determine cardiovascular risk in individuals with metabolic syndrome or established/progressing coronary artery disease, individuals with triglyceride levels between 70 and 140 mg/dL, as well as individuals with a diet high in trans-fat or carbohydrates. Elevated sdLDL levels are associated with metabolic syndrome and an 'atherogenic lipoprotein profile', and are a strong, independent predictor of cardiovascular disease. Elevated levels of LDL arise from multiple sources. A major factor is sedentary lifestyle with a diet high in saturated fat. Insulin-resistance and pre-diabetes have also been implicated, as has genetic predisposition. Measurement of sdLDL allows the clinician to get a more comprehensive picture of lipid risk factors and tailor treatment accordingly. Reducing LDL levels will reduce the risk of CVD and MI.

Recommendations:

Results of Lipids should always be interpreted in conjunction with the patient's medical history, clinical presentation and other findings.

NON FASTING LIPID PROFILE includes Total Cholesterol, HDL Cholesterol and calculated non-HDL Cholesterol. It does not include triglycerides and may be best used in patients for whom fasting is difficult.

SERUM BLOOD UREA NITROGEN-Causes of Increased levels

Pre renal

- High protein diet, Increased protein catabolism, GI haemorrhage, Cortisol, Dehydration, CHF Renal
- Renal Failure

Post Renal

- Malignancy, Nephrolithiasis, Prostatism

Causes of decreased levels

- Liver disease

- SIADH.

CREATININE, SERUM-Higher than normal level may be due to:

- Blockage in the urinary tract
- Kidney problems, such as kidney damage or failure, infection, or reduced blood flow
- Loss of body fluid (dehydration)
- Muscle problems, such as breakdown of muscle fibers
- Problems during pregnancy, such as seizures (eclampsia), or high blood pressure caused by pregnancy (preeclampsia)

Lower than normal level may be due to:

- Myasthenia Gravis
- Muscular dystrophy

URIC ACID, SERUM-Causes of Increased levels

Dietary

- High Protein Intake.
- Prolonged Fasting,
- Rapid weight loss.

Gout

Lesch nyhan syndrome.

Type 2 DM.

Metabolic syndrome.

Causes of decreased levels

- Low Zinc Intake
- OCP's
- Multiple Sclerosis

Nutritional tips to manage increased Uric acid levels

- Drink plenty of fluids
- Limit animal proteins
- High Fibre foods
- Vit C Intake
- Antioxidant rich foods

TOTAL PROTEIN, SERUM-Serum total protein, also known as total protein, is a biochemical test for measuring the total amount of protein in serum. Protein in the plasma is made up of albumin and globulin

Higher-than-normal levels may be due to: Chronic inflammation or infection, including HIV and hepatitis B or C, Multiple myeloma, Waldenstrom's disease

Lower-than-normal levels may be due to: Agammaglobulinemia, Bleeding (hemorrhage), Burns, Glomerulonephritis, Liver disease, Malabsorption, Malnutrition, Nephrotic syndrome, Protein-losing enteropathy etc.

ALBUMIN, SERUM-Human serum albumin is the most abundant protein in human blood plasma. It is produced in the liver. Albumin constitutes about half of the blood serum protein. Low blood albumin levels (hypoalbuminemia) can be caused by: Liver disease like cirrhosis of the liver, nephrotic syndrome, protein-losing enteropathy, Burns, hemodialysis, increased vascular permeability or decreased lymphatic clearance, malnutrition and wasting etc.

ELECTROLYTES (NA/K/CL), SERUM-ELECTROLYTES (NA/K/CL), SERUM

Sodium levels are Increased in dehydration, cushing's syndrome, aldosteronism & decreased in Addison's disease, hypopituitarism, liver disease. Hypokalemia (low K) is common in vomiting, diarrhea, alcoholism, folic acid deficiency and primary aldosteronism. Hyperkalemia may be seen in end-stage renal failure, hemolysis, trauma, Addison's disease, metabolic acidosis, acute starvation, dehydration, and with rapid K infusion. Chloride is increased in dehydration, renal tubular acidosis (hyperchloremia metabolic acidosis), acute renal failure, metabolic acidosis associated with prolonged diarrhea and loss of sodium bicarbonate, diabetes insipidus, adrenocortical hyperfunction, salicylate intoxication and with excessive infusion of isotonic saline or extremely high dietary intake of salt. Chloride is decreased in overhydration, chronic respiratory acidosis, salt-losing nephritis, metabolic alkalosis, congestive heart failure, Addisonian crisis, certain types of metabolic acidosis, persistent gastric secretion and prolonged vomiting.

URINALYSIS-Routine urine analysis assists in screening and diagnosis of various metabolic, urological, kidney and liver disorders

Protein: Elevated proteins can be an early sign of kidney disease. Urinary protein excretion can also be temporarily elevated by strenuous exercise, orthostatic proteinuria, dehydration, urinary tract infections and acute illness with fever

Glucose: Uncontrolled diabetes mellitus can lead to presence of glucose in urine. Other causes include pregnancy, hormonal disturbances, liver disease and certain medications.

Ketones: Uncontrolled diabetes mellitus can lead to presence of ketones in urine. Ketones can also be seen in starvation, frequent vomiting, pregnancy and strenuous exercise.

Blood: Occult blood can occur in urine as intact erythrocytes or haemoglobin, which can occur in various urological, nephrological and bleeding disorders.

Leukocytes: An increase in leukocytes is an indication of inflammation in urinary tract or kidneys. Most common cause is bacterial urinary tract infection.

Nitrite: Many bacteria give positive results when their number is high. Nitrite concentration during infection increases with length of time the urine specimen is retained in bladder prior to collection.

pH: The kidneys play an important role in maintaining acid base balance of the body. Conditions of the body producing acidosis/ alkalosis or ingestion of certain type of food can affect the pH of urine.

Specific gravity: Specific gravity gives an indication of how concentrated the urine is. Increased specific gravity is seen in conditions like dehydration, glycosuria and proteinuria while decreased specific gravity is seen in excessive fluid intake, renal failure and diabetes insipidus.

Bilirubin: In certain liver diseases such as biliary obstruction or hepatitis, bilirubin gets excreted in urine.

Urobilinogen: Positive results are seen in liver diseases like hepatitis and cirrhosis and in cases of hemolytic anemia

MAGNESIUM, SERUM-Moderate or severe magnesium deficiency is usually due to losses of magnesium from gastrointestinal tract or kidneys as in vomiting and diarrhoea in former and alcohol, diabetes mellitus (osmotic diuresis), loop diuretics (furosemide) and aminoglycoside antibiotics in latter.

Symptomatic hypermagnesemia is almost always caused by excessive intake with concomitant renal failure, thereby decreasing the ability of the kidneys to excrete excess magnesium.

Magnesium concentration in erythrocytes are approximately three times those of serum. Conversion factors for the units used to express magnesium concentration are:

mg/dl = meq/l x 1.22 = mmol/l x 2.43

HEPATITIS B SURFACE ANTIGEN, SERUM-Hepatitis B is caused by infection with HBV, a enveloped DNA agent that is classified as hepadnavirus. This test detects the presence of viral surface antigen (HbsAg) in serum sample and is indicative of an active HBV infection, either acute or chronic.

Test Utility:

HbsAg is the first serologic marker appearing in the serum 6-16 weeks following hepatitis B viral infection. In typical HBV infection, HbsAg will be detected 2-4 weeks before the liver enzyme levels (ALT) become abnormal and 3-5 weeks before patient develops jaundice. In acute cases HbsAg usually disappears 1-2 months after the onset of symptoms. Persistence of HbsAg for more than 6 months indicates development of either a chronic carrier state or chronic liver disease. The presence of HbsAg is frequently associated with infectivity. HbsAg when accompanied by Hepatitis Be antigen and/or hepatitis B viral DNA almost always indicates infectivity.

Limitations:

- For diagnostic purposes, results should be used in conjunction with patient history and other hepatitis markers for diagnosis of acute or chronic infection. If the antibody results are inconsistent with clinical evidence, additional testing is suggested to confirm the result.

- HbsAg detection will only indicate the presence of surface antigens in the serum and should not be used as the sole criteria for diagnosis, staging or monitoring of HBV infection. This test may be negative during "window period" i.e. after disappearance of anti-HBs.

- The current assay being a highly sensitive test, may yield a small percentage of false positive reports. Hence all HbsAg positive specimens should be confirmed with an assay based upon Neutralisation of Human anti Hepatitis B Surface antibody.

CONDITIONS OF LABORATORY TESTING & REPORTING

1. It is presumed that the test sample belongs to the patient named or identified in the test requisition form.
2. All Tests are performed and reported as per the turnaround time stated in the SRL Directory of services (DOS).
3. SRL confirms that all tests have been performed or assayed with highest quality standards, clinical safety & technical integrity.
4. A requested test might not be performed if:
 - a. Specimen received is insufficient or inappropriate specimen quality is unsatisfactory
 - b. Incorrect specimen type
 - c. Request for testing is withdrawn by the ordering doctor or patient
 - d. There is a discrepancy between the label on the specimen container and the name on the test requisition form
5. The results of a laboratory test are dependent on the quality of the sample as well as the assay technology.
6. Result delays could be because of uncontrolled circumstances. e.g. assay run failure.
7. Tests parameters marked by asterisks are excluded from the "scope" of NABL accredited tests. (If laboratory is accredited).
8. Laboratory results should be correlated with clinical information to determine Final diagnosis.
9. Test results are not valid for Medico- legal purposes.
10. In case of queries or unexpected test results please call at SRL customer care (91115 91115). Post proper investigation repeat analysis may be carried out.
